

PSE Data Security GmbH provides a number of packaged services designed to strengthen the security of Enterprise Applications. These services are grouped under the following categories:

[Audit and Review](#) | [Strengthening Security](#) | [Security Administration](#) | [Security Consulting](#) | [Technical Consulting](#)

Details of just some of these services are given below. Please contact PSE for any further information or visit our website at <http://www.psedatasecurity.com>.

[Strengthening Security](#) | [SSL:PKI Implementation](#)

Using SSL (Single Socket Layer) and PKI (Public Key Infrastructure) is essential if a browser based application is to be secure. PSE offers a comprehensive SSL:PKI implementation service including the configuration and securing of the following components:

Web Server | Certificate Infrastructure | Application Authentication | LDAP Integration
Network Secured Zone | Demilitarized Zone | Transport Layer | Workstation | Browser

HTTP is not secure and sensitive data can easily be compromised. Only HTTPS will encrypt data during transport and for this reason alone SSL:PKI should be considered high priority. PSE provides rapid and complete implementation of SSL:PKI.

[Audit and Review](#) | [Security Healthcheck](#)

In our experience most enterprise scale applications have serious security holes post implementation. PSE specialises in the Security Review of mainstream ERP applications. We identify those areas that need immediate attention and help CIO's to comply with their Company Security Policy. Where post implementation guarantees include a security component we help clients by providing systems, legal, and contractual evidence.

[Technical Consulting](#) | [PeopleSoft DBA Services](#)

Our experienced and professional PeopleSoft specialised consultants are all qualified PeopleSoft DBA's. Initially they earned DBA status with five or more years experience with one or more databases such as Oracle, SQL Server, DB2, or Informix and then achieved PeopleSoft DBA with a further three years experience in this popular ERP suite.

PSE has PeopleSoft DBA availability specialising in the fields of HCM, Payroll, Financials and SCM, CRM, Manufacturing, and Learning Management. We also offer a remote DBA service

[Security Administration](#) | [Remote Administration](#)

The security administration of enterprise scale applications is often perceived as a full time position. At PSE we have determined that with appropriate workflow it is feasible and advantageous to outsource this function and save significantly on staffing costs. PSE provides a comprehensive remote security administration service under our Client Support Programme.

PSE has Security Administrator availability specialising in the fields of PeopleSoft, Oracle, and SAP.

[Client Support programme](#)

PSE supports current and new clients under one of two Support Programmes:

Onsite Support includes guaranteed response levels plus a number of days on-site activity as agreed on an individual basis and designed to support medium to large size clients.

Remote Support includes guaranteed response levels plus regular remote access via NetOp over the internet (using our secure gateway) or via dialup.
